## Lecture 8 – Simple Linear Regression

**DSC 40A, Spring 2023** 

#### **Announcements**

- ▶ Discussion is tonight at 7pm or 8pm in FAH 1101.
  - Please attend the section you are enrolled in.
  - Come to work on Groupwork 3, which is due tonight at 11:59pm.
  - ► It's a pretty long groupwork assignment; it's okay if you don't finish, but review the solutions afterwards because they'll help with Homework 3.
- ► Homework 3 is out, due **Tuesday at 11:59pm**.

#### **Agenda**

- Recap of Lecture 7.
- Minimizing mean squared error for the linear prediction rule.
- Connection with correlation.

# **Recap of Lecture 7**

#### **Linear prediction rules**

- New: Instead of predicting the same future value (e.g. salary) h for everyone, we will now use a **prediction rule** H(x) that uses **features**, i.e. information about individuals, to make predictions.
- We decided to use a **linear** prediction rule, which is of the form  $H(x) = w_0 + w_1 x$ .

 $\triangleright$   $w_0$  and  $w_1$  are called parameters.

#### Finding the best linear prediction rule

- In order to find the best linear prediction rule, we need to pick a loss function and minimize the corresponding empirical risk.
  - We chose squared loss,  $(y_i H(x_i))^2$ , as our loss function.
- ► The MSE is a function  $R_{sq}$  of a function H.

$$R_{sq}(H) = \frac{1}{n} \sum_{i=1}^{n} \left( \underline{y_i} - \underline{H(x_i)} \right)^2$$

▶ But since H is linear, we know  $H(x_i) = w_0 + w_1 x_i$ .

$$R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))^2$$

# Finding the best linear prediction rule

Goal: Find the slope  $w_1$  and intercept  $w_0^*$  that minimize the MSE,  $R_{sq}(w_0, w_1)$ :

$$R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))^2$$

**Strategy:** To minimize  $R(w_0, w_1)$ , compute the gradient (vector of partial derivatives), set it equal to zero, and solve.

Minimizing mean squared error for the linear

prediction rule

$$R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))^2$$

#### **Discussion Question**

Choose the expression that equals  $\frac{\partial R_{sq}}{\partial w_0}$ 

a) 
$$\frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))$$

b) 
$$-\frac{1}{n}\sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))$$

c) 
$$-\frac{2}{n}\sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i)) x_i$$

d) 
$$-\frac{2}{n}\sum_{i=1}^{n}(y_i-(w_0+w_1x_i))$$

$$R_{sq}(w_{0}, w_{1}) = \frac{1}{n} \sum_{i=1}^{n} (y_{i} - (w_{0} + w_{1}x_{i}))^{2}$$

$$\frac{\partial R_{sq}}{\partial w_{0}} = \frac{1}{n} \sum_{i=1}^{n} \frac{dR_{sq}}{dw_{0}} ((y_{i} - (w_{0} + w_{1}x_{i}))^{2})$$

$$= \frac{1}{n} \sum_{i=1}^{n} 2 (y_{i} - (w_{0} + w_{1}x_{i})) \cdot -1$$

$$= -\frac{1}{n} \sum_{i=1}^{n} (y_{i} - (w_{0} + w_{1}x_{i}))^{2}$$

$$R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))^2$$

$$\frac{\partial R_{sq}}{\partial w_1} = \frac{1}{n} \sum_{i=1}^{n} 2 (y_i - (w_0 + w_1 x_i)) \cdot - \chi_i$$

$$= -\frac{2}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i)) \cdot \chi_i$$

Strategy 
$$\frac{\partial R_{s_i}}{\partial w_0} = 0$$
  $\frac{\partial R_{s_i}}{\partial w_0} = 0$   $-\frac{2}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i)) x_i = 0$ 

- 1. Solve for  $w_0$  in first equation.
  - The result becomes  $w_0^*$ , since it is the "best intercept".
- 2. Plug  $w_0^*$  into second equation, solve for  $w_1$ .
  - ▶ The result becomes  $w_1^*$ , since it is the "best slope".

Solve for 
$$w_1^*$$

$$\frac{1}{\sqrt{2}} \sum_{i=1}^{n} (y_i - (\underline{w}_0 + w_1 x_i)) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - (\underline{y} - w_1 \overline{x}) + w_1 x_i)) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - (\underline{y} - w_1 \overline{x}) + w_1 x_i)) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - (\underline{y} - w_1 \overline{x}) + w_1 x_i)) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i) x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{x} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{y} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{y} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{y} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{y} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{y} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) + w_1 \overline{y} - w_1 x_i = 0$$

$$\frac{1}{\sqrt{2}} (\underline{y}_i - \underline{y}) +$$

#### **Least squares solutions**

We've found that the values  $w_0^*$  and  $w_1^*$  that minimize the function  $R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^n (y_i - (w_0 + w_1 x_i))^2$  are

$$w_{1}^{*} = \frac{\sum_{i=1}^{n} (y_{i} - \bar{y}) x_{i}}{\sum_{i=1}^{n} (x_{i} - \bar{x}) x_{i}}$$

$$w_{0}^{*} = \bar{y} - w_{1}^{*} \bar{x}$$

where

$$\bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i$$
  $\bar{y} = \frac{1}{n} \sum_{i=1}^{n} y_i$ 

Let's re-write the slope  $w_1^*$  to be a bit more symmetric.

#### **Key fact**

The **sum of deviations from the mean** for any dataset is 0.

Proof: 
$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

$$\sum_{i=1}^{n} (x_i - \bar{x}) = 0 \qquad \sum_{i=1}^{n} (y_i - \bar{y}) = 0$$

# Equivalent formula for w<sub>1</sub>\*

Claim 
$$\frac{\sum_{i=1}^{n} (y_i - \bar{y}) x_i}{\sum_{i=1}^{n} (y_i - \bar{y}) x_i} = \frac{\sum_{i=1}^{n} (y_i - \bar{y}) x_i}{\sum_{i=1}^{n} (y_i - \bar{y}) x_i}$$

laim 
$$\frac{1}{\sum_{i=1}^{n} (v_i - \bar{v}) x_i} \sum_{i=1}^{n} (x_i - \bar{v}) x_i$$

$$|\bar{y}\rangle x_i$$

$$= \sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})$$

ginal new, more symmetric 
$$= \sum_{i=1}^{n} \chi_{i}(y_{i} \cdot \bar{y}) - \sum_{i=1}^{n} \bar{\chi}(y_{i} \cdot \bar{y})$$

al new, more s
$$\sum_{i=1}^{n} \chi_{i}(y_{i} \cdot \overline{y}) = 0$$

$$\frac{\sum_{i=1}^{n} \chi_{i}(y_{i} \cdot \bar{y}) - \sum_{i=1}^{n} \bar{\chi}(y_{i})}{\sum_{i=1}^{n} \chi_{i}(y_{i} \cdot \bar{y})}$$

$$(x;-\overline{x})(y;-\overline{u}) = \sum_{i=1}^{n} x_i$$

Proof:

#### **Least squares solutions**

The least squares solutions for the slope  $w_1^*$  and intercept  $w_0^*$  are:

$$w_1^* = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2}$$

$$w_0^* = \bar{y} - w_1 \bar{x}$$

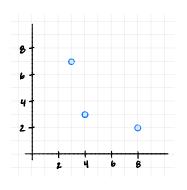

- ▶ We also say that  $w_0^*$  and  $w_1^*$  are optimal parameters.
- To make predictions about the future, we use the prediction rule

$$H^*(x) = W_0^* + W_1^* x$$

#### **Example**

#### **Example**

$$\bar{x} =$$

$$W_1^* = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2} =$$

$$w_0^* = \bar{y} - w_1^* \bar{x} =$$

x <sub>i</sub>	Уi	$(x_i - \bar{x})$	$(y_i - \bar{y})$	$(x_i - \bar{x})(y_i - \bar{y})$	$(x_i - \bar{x})^2$
3	7				
4	3				
8	2				

#### **Terminology**

- x: features.
- y: response variable.
- $\triangleright$   $w_0$ ,  $w_1$ : parameters.
- $\triangleright$   $w_0^*$ ,  $w_1^*$ : optimal parameters.
  - Optimal because they minimize mean squared error.
- The process of finding the optimal parameters for a given prediction rule and dataset is called "fitting to the data".
- $R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i (w_0 + w_1 x_i))^2$ : mean squared error, empirical risk.

#### **Discussion Question**

Consider a dataset with just two points, (2, 5) and (4, 15). Suppose we want to fit a linear prediction rule to this dataset by minimizing mean squared error. What are the values of  $w_0^*$  and  $w_1^*$  that minimize mean squared error?

a) 
$$W_0^* = 2, W_1^* = 5$$

b) 
$$w_0^* = 3, w_1^* = 10$$

c) 
$$w_0^* = -2, w_1^* = 5$$

d) 
$$W_0^* = -5$$
,  $W_1^* = 5$ 

# **Connection with correlation**

# Patterns in scatter plots

#### **Correlation coefficient**

- ▶ In DSC 10, you were introduced to the idea of correlation.
  - It is a measure of the strength of the **linear** association of two variables, x and y.
  - Intuitively, it measures how tightly clustered a scatter plot is around a straight line.
  - ► It ranges between -1 and 1.

### Patterns in scatter plots

#### **Definition of correlation coefficient**

- The correlation coefficient, r, is defined as the average of the product of x and y, when both are in standard units.
  - Let  $\sigma_x$  be the standard deviation of the  $x_i$ 's, and  $\bar{x}$  be the mean of the  $x_i$ 's.
  - $ightharpoonup x_i$  in standard units is  $\frac{x_i \bar{x}}{\sigma_x}$ .
  - ► The correlation coefficient is

$$r = \frac{1}{n} \sum_{i=1}^{n} \frac{\left(x_{i} - \bar{x}\right) \left(y_{i} - \bar{y}\right)}{\sigma_{x}}$$
Variance

#### Another way to express $W_1^*$

It turns out that  $w_1^*$ , the optimal slope for the linear prediction rule, can be written in terms of r!

$$w_1^* = \frac{\sum_{i=1}^{n} (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^{n} (x_i - \bar{x})^2} = r \frac{\sigma_y}{\sigma_x}$$

- It's not surprising that r is related to  $w_1^*$ , since r is a measure of linear association.
- ► Concise way of writing  $w_0^*$  and  $w_1^*$ :

$$w_1^* = r \frac{\sigma_y}{\sigma_x} \qquad w_0^* = \bar{y} - w_1^* \bar{x}$$

# **Proof that** $w_1^* = r \frac{\sigma_y}{\sigma_x}$

### Interpreting the slope

- $\sigma_y$  and  $\sigma_x$  are always non-negative. As a result, the sign of the slope is determined by the sign of r.
- As the y values get more spread out,  $\sigma_y$  increases and so does the slope.
- As the x values get more spread out,  $\sigma_x$  increases and the slope decreases.

### Interpreting the intercept

$$w_0^* = \bar{y} - w_1^* \bar{x}$$

▶ What is  $H^*(\bar{x})$ ?

#### **Discussion Question**

We fit a linear prediction rule for salary given years of experience. Then everyone gets a \$5,000 raise. Which of these happens?

- a) slope increases, intercept increases
- b) slope decreases, intercept increases
- c) slope stays same, intercept increases
- d) slope stays same, intercept stays same
